(a) Enrolment / probe split

identity p has 10 images

enrol (5) probe (5)

The same split is used for Map A and Map B. Primary result: mean over five seeded splits (0–4); a fixed first-half/second-half split is kept only as a session-bias check. The pair-level analysis in Section **??** uses a different protocol (all unordered pairs), so its AUC is not directly comparable with the operating points below.
